Probably the first nonfiction book written about pterosaurs sightings from coast-to-coast, *Live Pterosaurs in America* escorts you through extraordinary investigations by Jonathan Whitcomb, one of the world's leading experts in pterosaur sightings. Investigate the credibility of these sightings through the words of the eyewitnesses of creatures that the textbooks tell us are long extinct. Learn why those books are wrong. Discover what really flies overhead.

From Readers of the First Edition:

"I found this book very interesting . . . The problem with science is that we think we know it all and that is far from reality. This book shows courage to continue the search. If you have an interest in cryptozoology you should read this." (Dale Reeder, PA; Amazon review)

"He has focused on the accounts of witnesses who saw something, and that adds credibility. The writing is easy to read and he adds comments and analysis to make it all more useful . . . a worthwhile book." (Five stars given by "Red Rabbit," Cleveland, Ohio)

Email from a reader in South Carolina: "Your new book arrived today! . . . you really did a wonderful job!!! You not only gave everyone more sightings than they can dispute (21 states!!!), but you also wove a descriptive and engaging ongoing investigation . . . To have so MANY sightings recorded should NOT be ignored. . . . Thank you again for the WONDERFUL book!!!!!!!" (Susan Wooten, an eyewitness)

Jonathan D. Whitcomb is also the author of the non-fiction *Searching for Ropens, Live Pterosaurs in Papua New Guinea*.

How can giant "pterodactyls," distinctly non-extinct, live in the United States of America? Why have many credible eyewitnesses been ignored by the news media? And how do four kinds of fear threaten to haunt those who have encountered the creatures?

Living pterosaurs and ignorant news professionals—both are explained in the book. The four kinds of fear involve an eyewitness's doubt in what the eyes have seen, what the creature might do, what other people might think, and how wrong our cultural views can be. Few people have courage to speak up.

What do about 80% of these sightings have in common? A typical eyewitness reports a long tail (often with a structure at the end, described in a way suggesting the tail vein of a Rhamphorhynchoid pterosaur).
